

Measurement of Directed Flow via three particle azimuthal correlations at RHIC-PHENIX

Hiroshi Masui
For the PHENIX Collaboration
JPS meeting

H. Masui / Univ. of Tsukuba
Spring JPS meeting @ Kyusyu University

Outline

- Azimuthal anisotropy
- Theoretical prediction of Directed Flow
- PHENIX experiment
- Analysis method
- Results
- Summary and Outlook

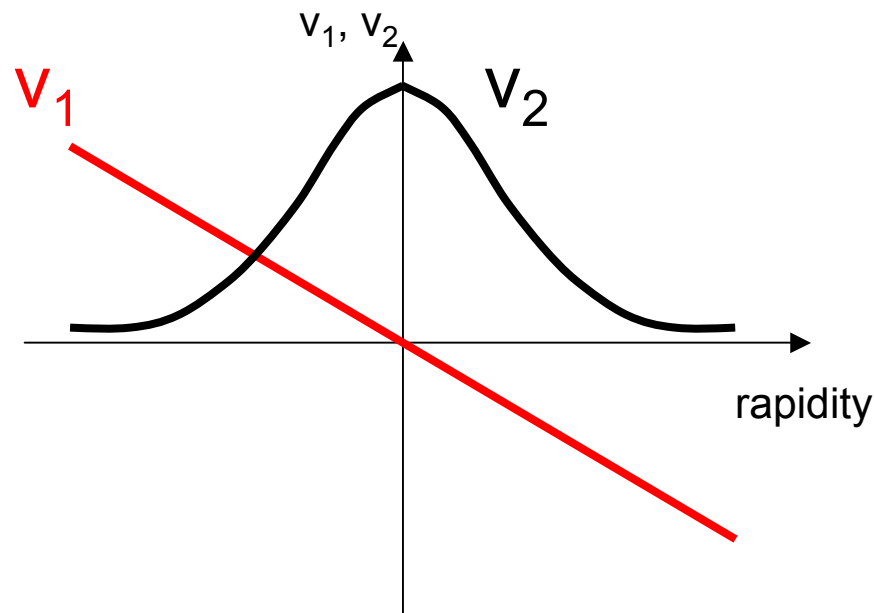

Azimuthal anisotropy

Directed/Elliptic Flow

$$E \frac{d^3 N}{d^3 p} = \frac{1}{2\pi} \frac{d^2 N}{p_T dp_T dy} \left(1 + \sum_{n=1}^{\infty} 2v_n \cos[n(\phi - \Psi)] \right)$$

v_n ($n=1,2$): strength of directed/elliptic flow
 ϕ : azimuthal angle of detected particles
 Ψ : azimuthal angle of reaction plane

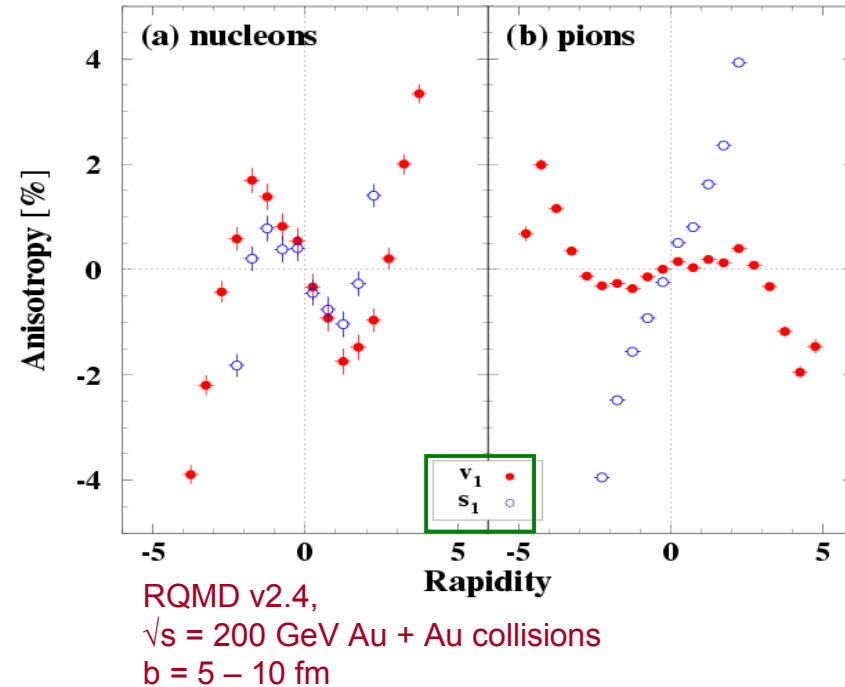

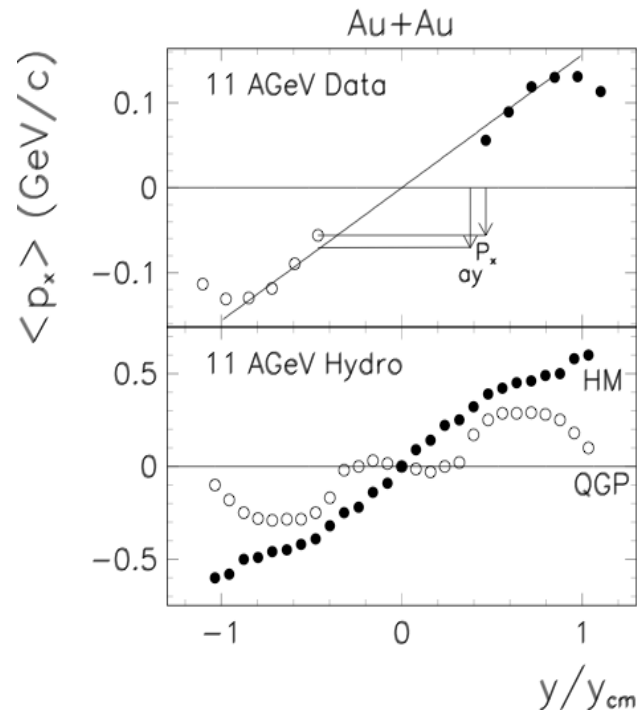

- Anisotropic Flow

- Directed/Elliptic Flow
- Sensitive to the system evolution at early time and the equation of state.
- Might be used to search for new state of matter (QGP) and phase transition.

Theoretical prediction of Directed Flow (v_1)

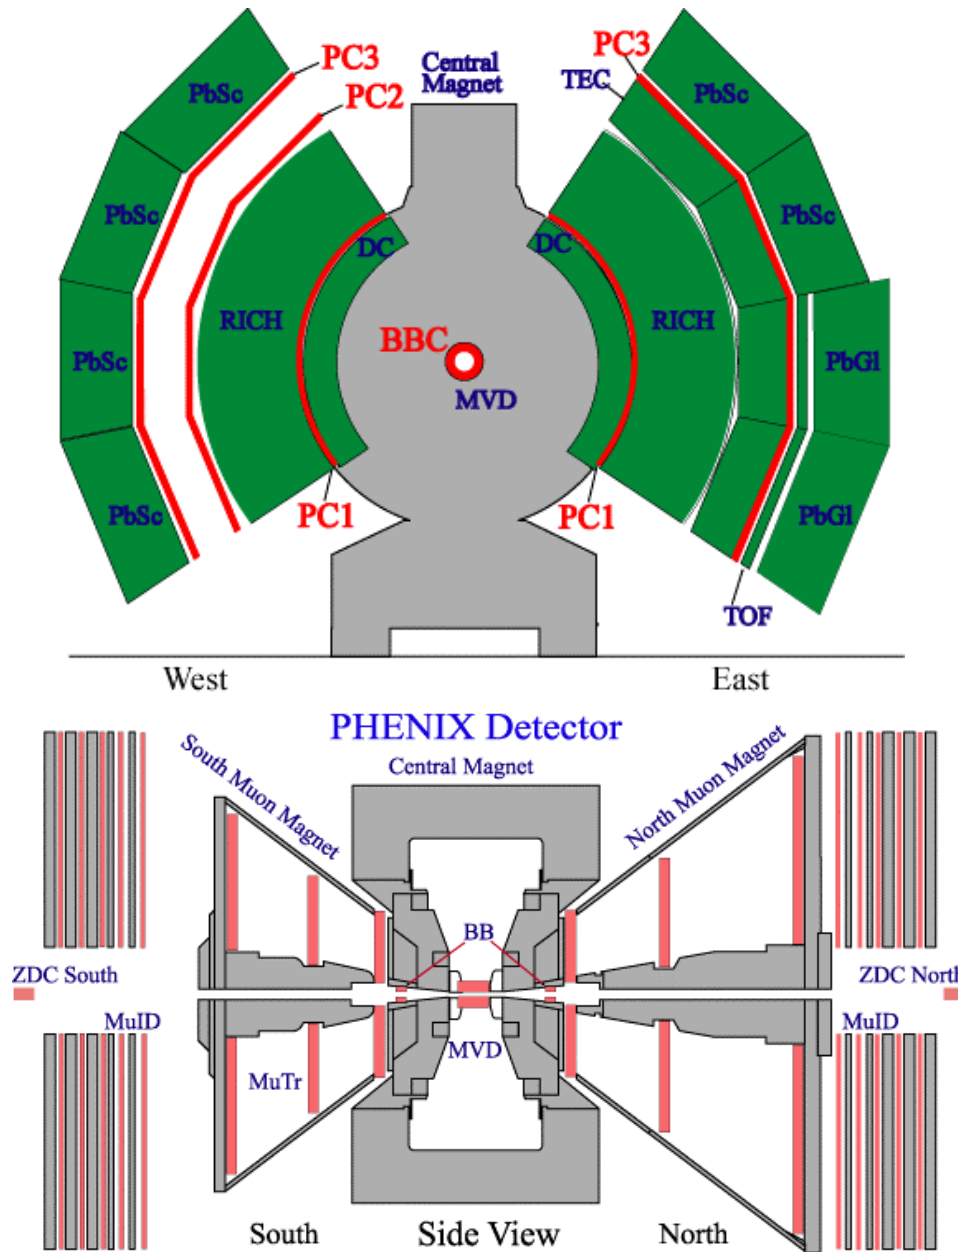

- Anti-flow/3rd flow component, with QGP
 - v_1 flat at mid-rapidity.
- v_1 wiggle, no QGP necessary
 - Baryon stopping
 - Positive space-momentum correlation

Experimental Setup PHENIX Detector

- Minimum Bias Trigger
 - BBC (Beam Beam Counter)
- Collision Vertex
 - BBC
- Centrality
 - BBC, ZDC (Zero Degree Calorimeter)
- Reaction Plane
 - BBC, DC (Drift Chamber), PC (Pad Chamber)
- Tracking / Momentum
 - DC, PC

Analysis method

- Reaction Plane method $v_1\{\text{RP}_1\}, v_2\{\text{RP}_2\}$

$$\left\langle e^{in(\phi-\Psi)} \right\rangle = v_n$$

- Two particle + Reaction Plane $v_1\{\text{RP}_2\}$

$$\left\langle e^{i(\phi_a+\phi_b-2\Psi_2)} \right\rangle = \underbrace{v_1^a v_1^b}_{\text{Central arm}} \left\langle \cos[2(\Psi_{\text{true}} - \Psi_2)] \right\rangle$$

- Three particle correlation $v_1\{3\}$

$$\left\langle e^{i(\phi_a+\phi_b-2\phi_c)} \right\rangle = \underbrace{v_1^a v_1^b}_{\text{BBC}} \underbrace{v_2^c}_{\text{Central arm}}$$

BBC

Basic fomula of three particle correlation method
N. Borghini, P.M. Dihn, J-Y. Ollitrault, PRC 014905 (2002)

Non-flow contribution

$$\langle \cos(\phi_a - \psi_2) \cos(\phi_b - \psi_2) - \sin(\phi_a - \psi_2) \sin(\phi_b - \psi_2) \rangle \approx v_{1a} v_{1b} v_2$$

In-plane component
Flow + Non-flow

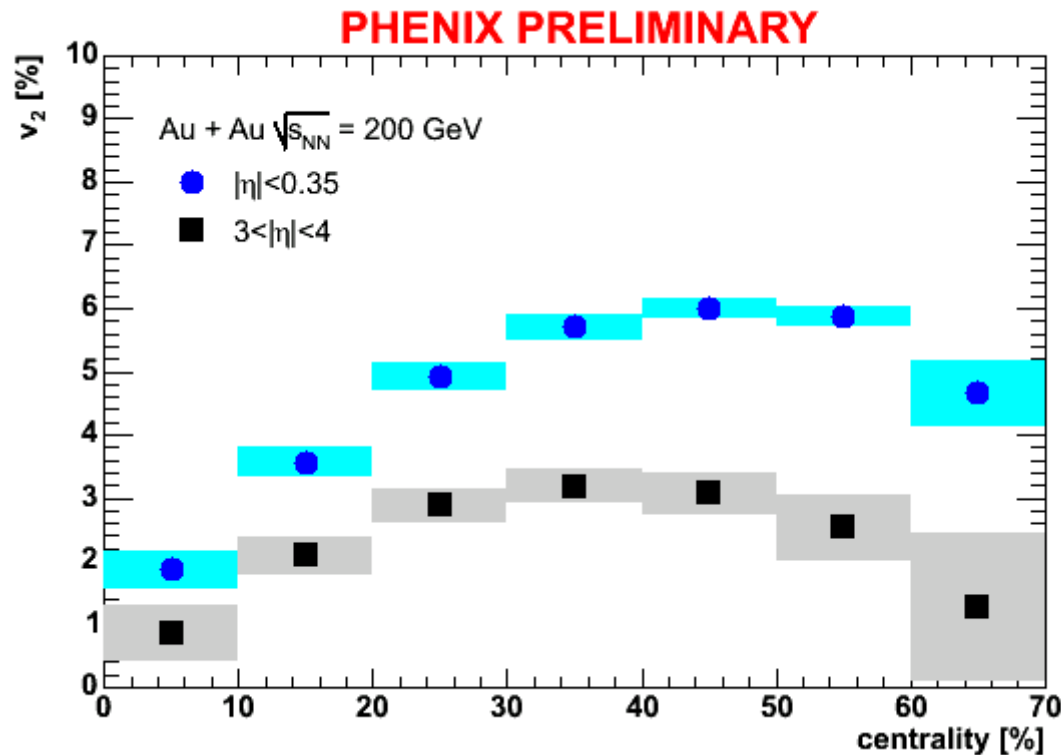

Out-of-plane component
Non-flow

- Three particle correlation (or two particle + reaction plane) is less sensitive to non-flow contribution than reaction plane method.
- Takes advantage of the knowledge about the reaction plane derived from the large elliptic flow
 - minimizes non-flow effect.
- Can measure the sign of v_2 .

Elliptic Flow $v_2\{RP_2\}$

Comparison of Mid-rapidity ($|\eta|<0.35$)
and Forward rapidity ($3<|\eta|<4$)

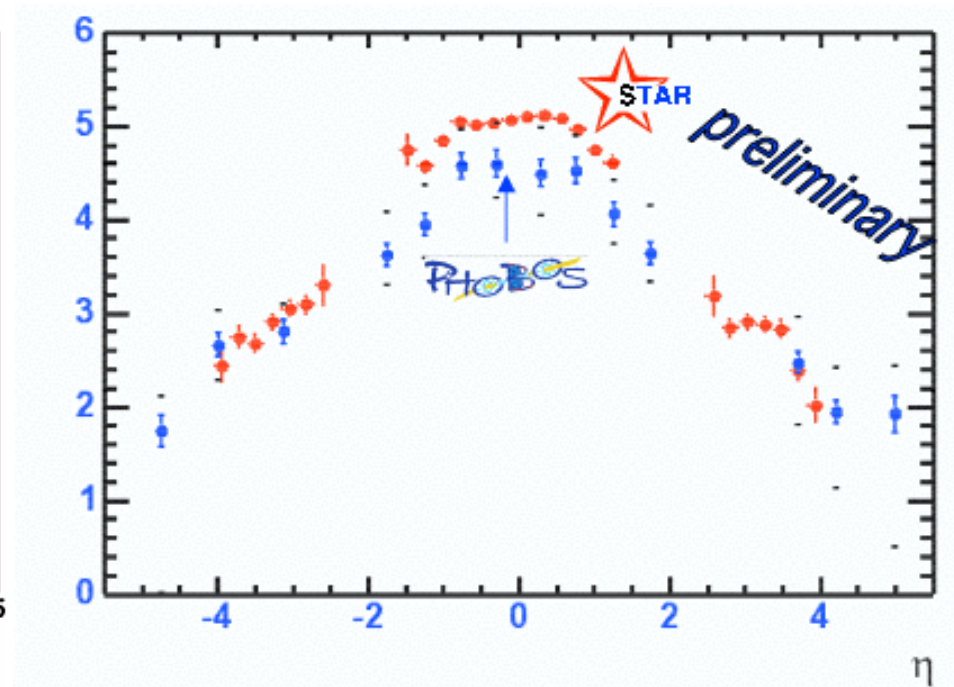

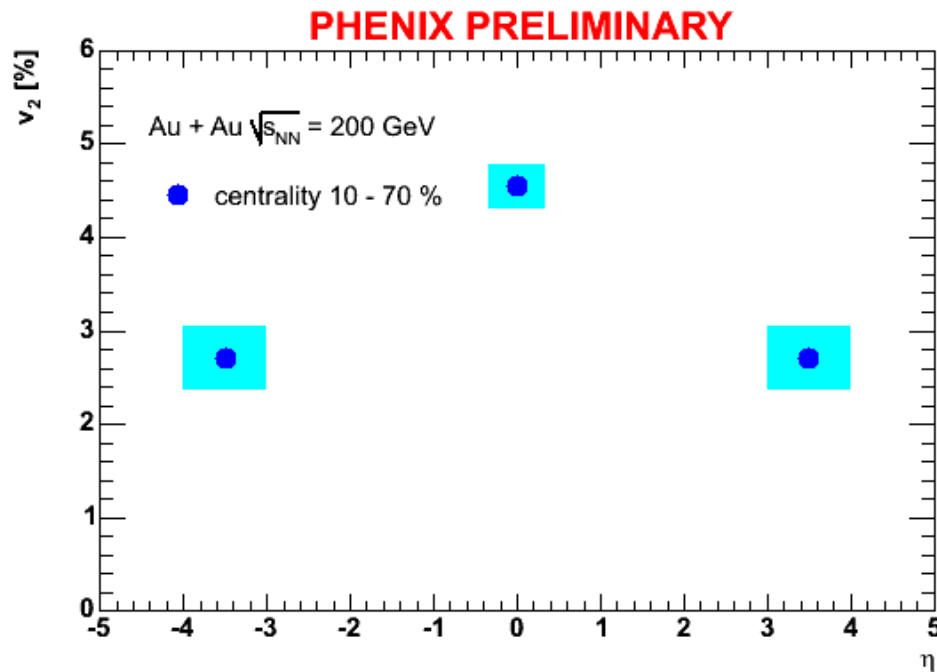

- Elliptic Flow measurement has been done by the standard reaction plane method @ mid-rapidity and forward rapidity.
- Used as input for 3 particle correlation method.

Elliptic Flow

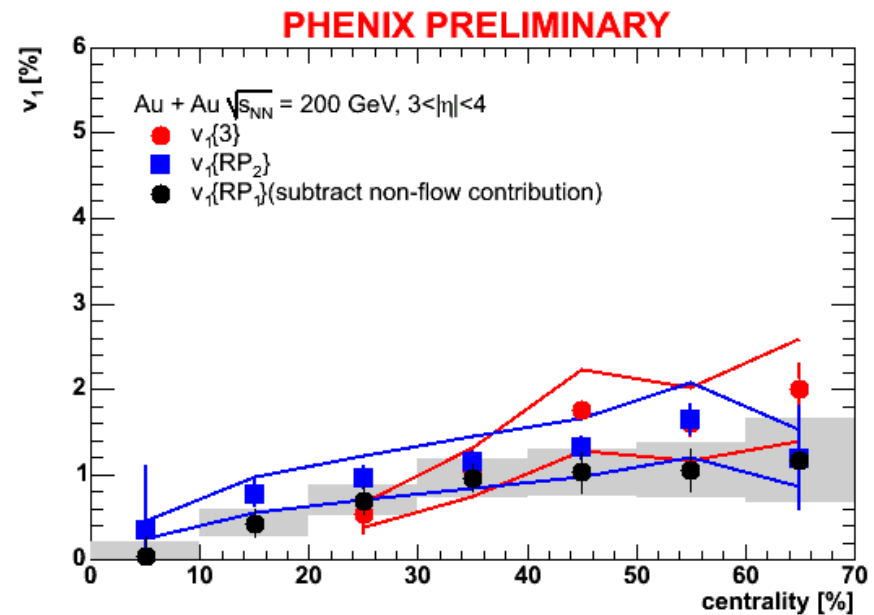

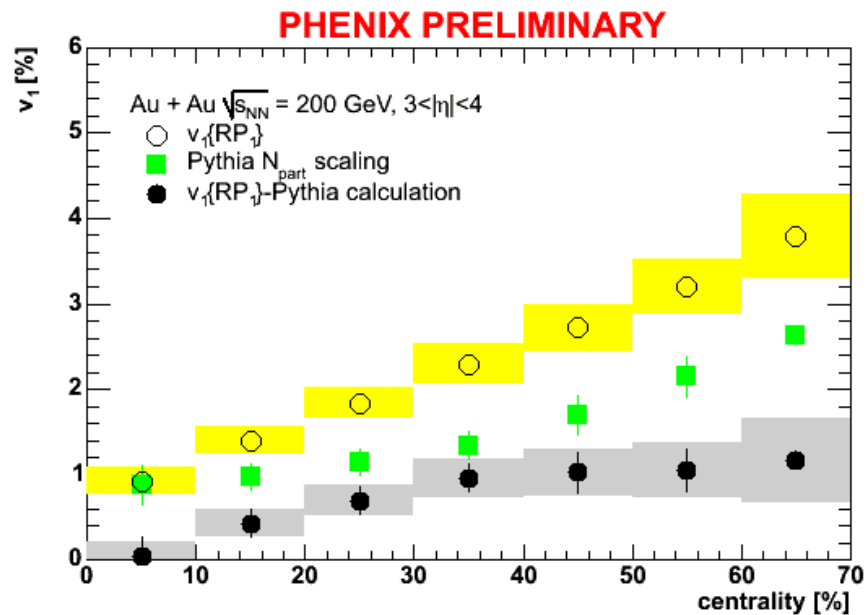

Comparison of PHENIX to other experiments

- PHENIX v_2 is consistent with PHOBOS and STAR results.

Directed Flow ($3 < |\eta| < 4$)

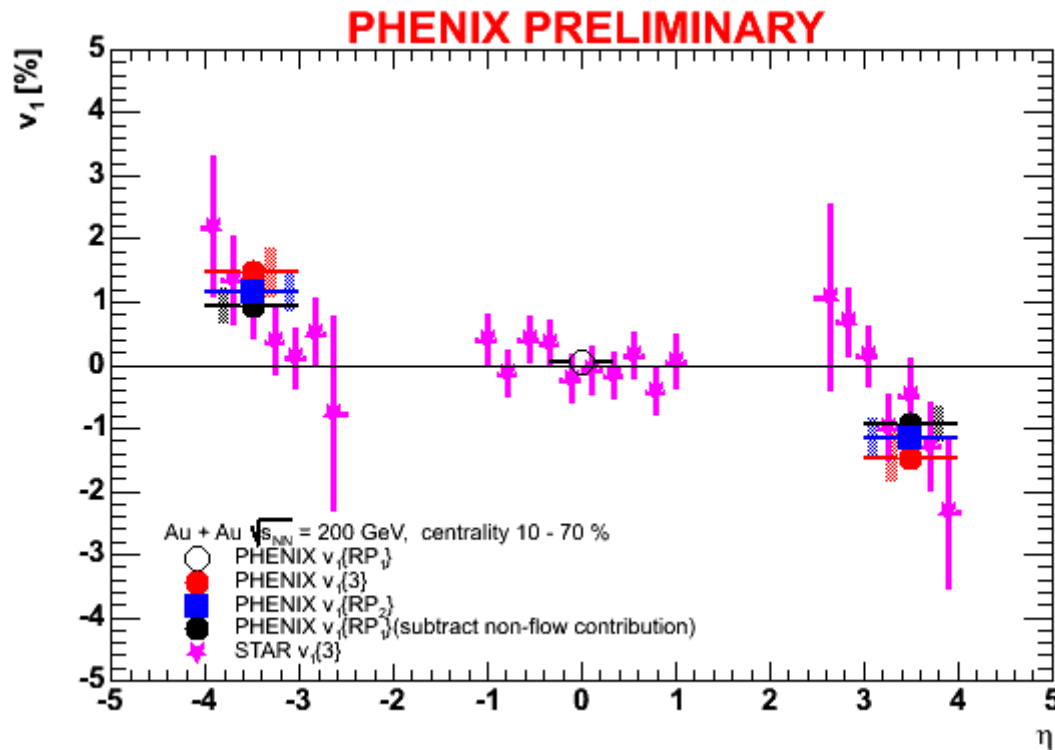

- \circ Flow + Non-flow ($v_1\{RP_1\}$)
- \blacksquare Non-flow
- \bullet Flow
- \bullet $v_1\{3\}$
- \blacksquare $v_1\{RP_2\}$

- Comparison of 3 independent analysis.
 - $v_1\{RP_1\}$ subtracted non-flow contribution.
 - $v_1\{RP_2\}$
 - $v_1\{3\}$
- Very good agreement within the error bars.

Directed Flow

Comparison of PHENIX and STAR

- Integrated Directed Flow in 10 – 70 % centrality bins.
 - Sign of v_1 is defined by hand.
 - Systematic errors are shown by color bands.
- Comparison of PHENIX results to STAR $v_1\{3\}$.
 - All of the PHENIX results are consistent with STAR $v_1\{3\}$.

Summary

Elliptic Flow

- First measurement of Elliptic Flow (v_2) in Forward rapidity ($3 < |\eta| < 4$) @ PHENIX.
 - Consistent with PHOBOS and STAR.

Directed Flow

- First measurement of Directed Flow (v_1) @ PHENIX.
- $v_1\{\text{RP}_2\}$ and $v_1\{3\}$ are less sensitive to non-flow contribution than v_1 from the standard reaction plane method.
- The results of v_1 @ PHENIX is consistent with $v_1\{3\}$ from STAR experiments.
- The results of $v_1\{\text{RP}_2\}$ and $v_1\{3\}$ indicate that v_2 @ RHIC is *in-plane* ($v_2 > 0$).

16ch. PMT "M16"

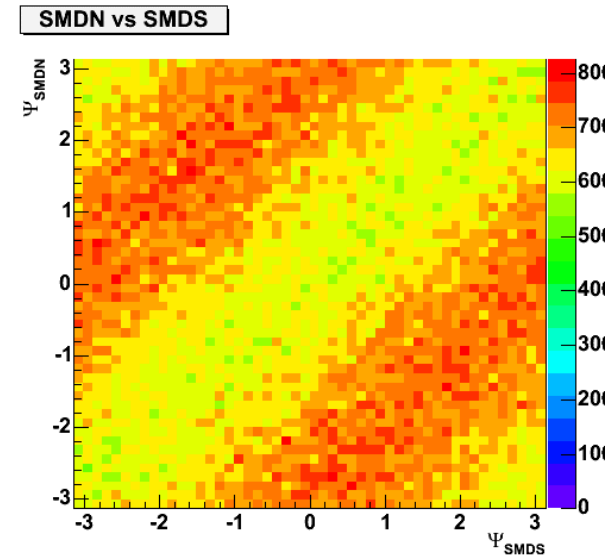

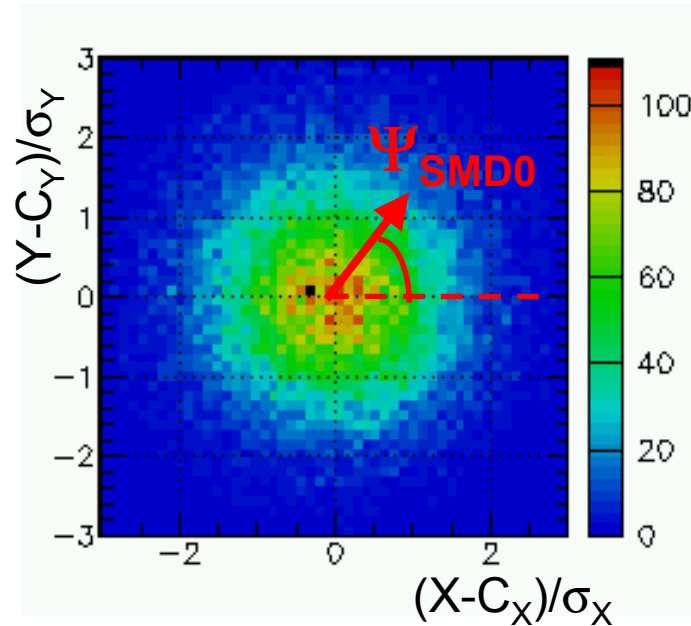

WLS fibers

Scintillator strips

Shower Maximum
Detector (SMD)

Outlook

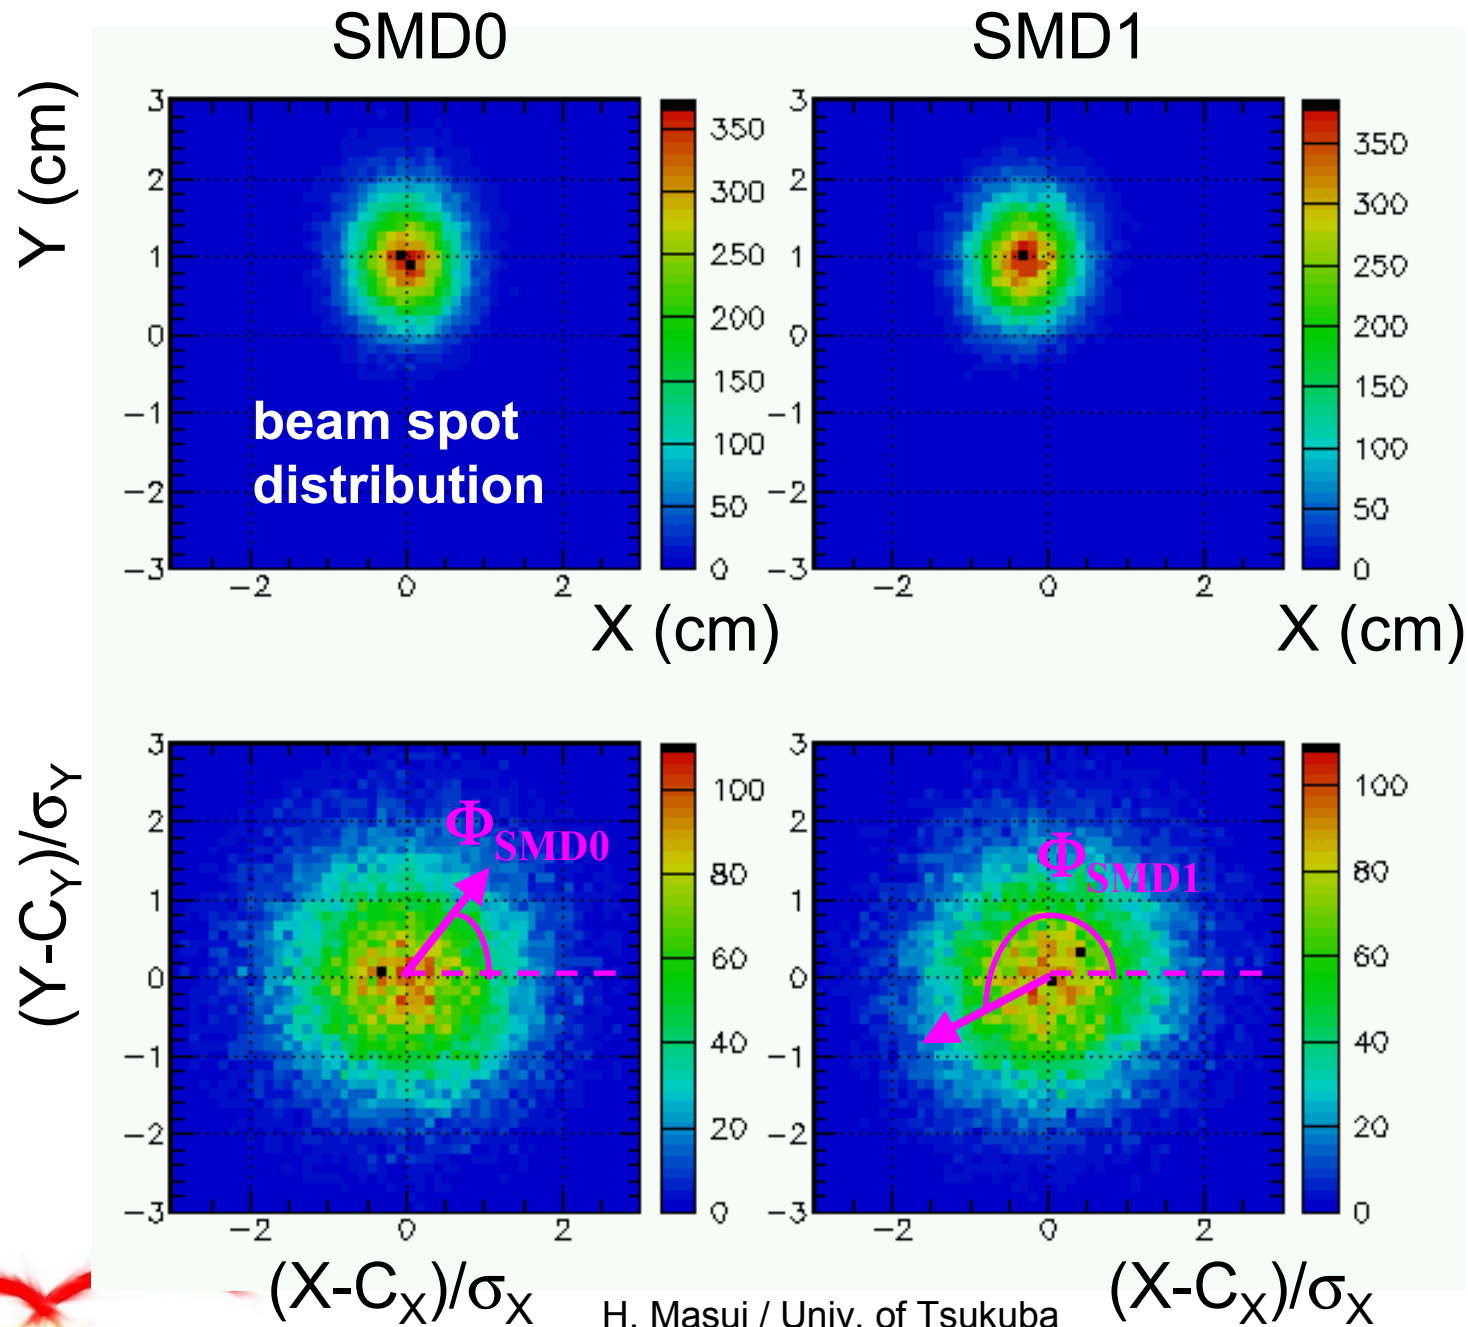

- Directed event plane determined @ SMD
 - Better resolution.
 - Less sensitive to non-flow contribution.
 - Opposite direction between BBC and SMD ↔ Directed Flow from Participant (pion) and Spectator (neutron).
